

# Predicting NBA Salaries

John Makhijani & Juna lafelice

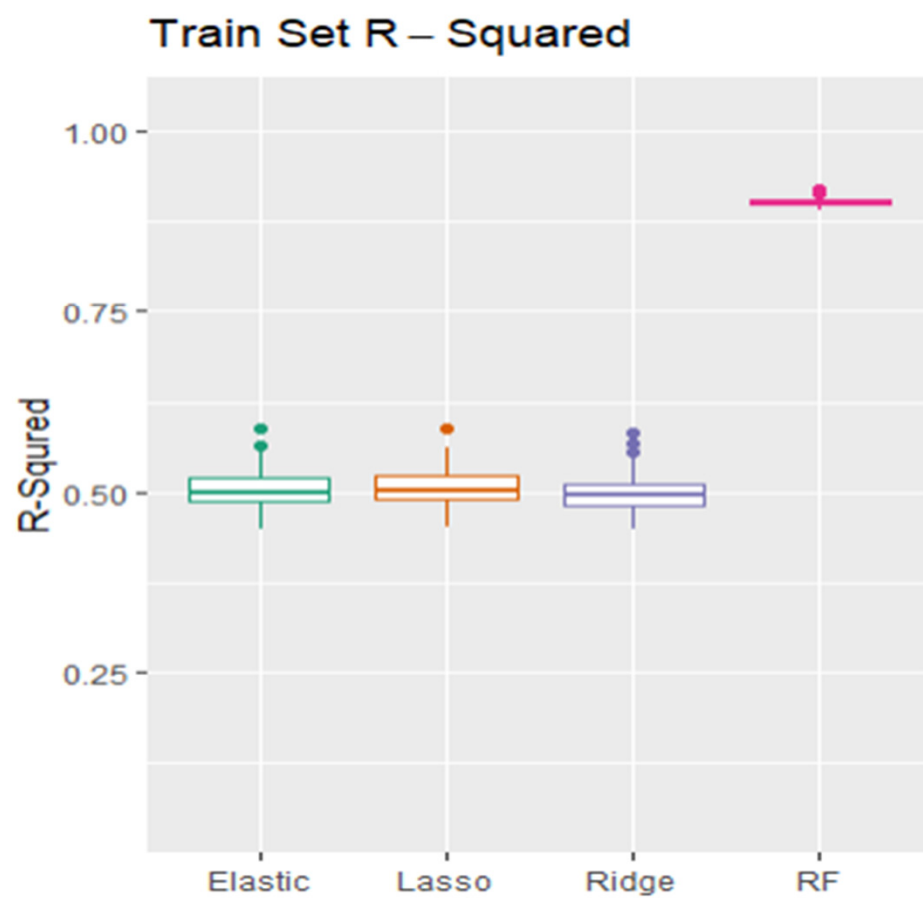

May 5, 2021

# NBA Dataset Description

**Goal** - Predict NBA player salaries based on player statistics

- Data Breakdown
  - Sample Size (n) – 413 | Predictors (p) – 41 | No missing data
  - Predictors based on 18/19 season, Salary based on 19/20 season
  - Response Variable – Salary
  - Predictors – Field Goals, Rebounds, Three Pointers, Games, Minutes, Points, Age, PER, VORP, WS, etc.
  - Data Source – [basketball-reference.com](https://www.basketball-reference.com) and [espn.com](https://www.espn.com)
- Adjustments
  - Top 5 salaries removed as outliers from n=418 dataset
  - Natural log taken of Salary data

$R^2_{test}$  and  $R^2_{train}$

# Cross Validation Curves

Elastic-net

38 37 33 30 27 27 23 22 21 18 16 16 13 12 11 10 8 4

Lasso

35 34 31 27 26 24 21 21 18 17 13 10 9 10 6 5 4 3

Ridge

41 41 41 41 41 41 41 41 41 41 41 41 41 41 41 41 41 41

	ELASTIC NET	LASSO	RIDGE	RANDOM FOREST
MEAN CV TIME(SECS)	0.217	0.269	0.099	1.027

# Residuals

## Train Set Residuals

## Test Set Residuals

## Estimated Coefficient

## Model Performance / Accuracy Tradeoff

	90% Test $R^2$ Interval	Time
ELASTIC NET	0.272 - 0.555	0.332 secs
LASSO	0.265 - 0.559	0.272 secs
RIDGE	0.276 - 0.563	0.194 secs
RANDOM FOREST	0.253 - 0.567	1.275 secs

## Conclusion

- We see an obvious overfitting issue with the training set  $R^2$  values of the Random Forest model that is not seen in the 3 other methods
- Ridge has the best performance in terms of  $R^2$  on the Test set  
(We are not considering Random Forest because of the overfitting issue)
- For the trade-off between model accuracy and processing time, Ridge gives us the highest  $R^2$  and the fastest time to run which makes it the best model to fit to predict NBA Salaries
